## App Name

I-SUcialize

## Github Repository

<https://github.com/umutondersu/i-sucialize>

## Description Of The End Product/App

It will be a reddit like application that people will “*SUcialize*” through hashtags and posts.

## Used Languages

Dart with Flutter SDK.

NoSQL with Firebase.

## Potential Outcome

“An app that people can gather and chat about any topic they like to talk about and share information via posts/chat.”

The user can login with both email and password, Gmail and Facebook accounts.

Users can follow other users and create accounts.

Users will have a personal profile page and manage their profile, message each other.

Users can like/dislike, share or report other posts.

Users can see all of their notifications in a “Notifications Page”.

Users can see the posts of his/her connections and subscribed topics/locations in the “Feeds Page”.

## How We Will Achieve the Required Functionalities

We will create a flutter application which uses firebase as its backend.

The user will get the notification if his/her post gets comments or someone else posts a new post or anyone will send a personal message to them.

Users can search and find Topics/Posts/Users via a search bar.

The user can see the amount of likes and comments a post got in the main page.

If a user logs in successfully a session is created.
